While the availability and affordability of consumer electronics had steadily increased during the 1970s, arguably the Christmas of 1980 was the first where electronic gifts became common. The cost of video-game consoles had fallen from the stratosphere, new low-priced competitors were introduced into the home computer market, and mass-produced Japanese toys, watches, video and audio equipment invaded shops and department stores at a time when consumers had money in their wallets.

This first issue of the "12 Years of Retro-Christmas" will look at all of these niches and more, giving you a sense (or triggering some memories) of what was under the tree on Christmas morning, 1980, from the Armatron to the Sony Walkman.

Come along with us as we take a look at some of the electronics of Christmas past.

Without a very shiny nose....

An animal of another type has been observed at the shop lately. He has probably been here a while, but his mannerisms were so similar to our own (sleeping, craving attention, begging for food, etc.), that nobody noticed him until recently. We got suspicious because he never frowned. Closer inspections revealed a furry skin and a looong nose. Grabbing "Clyde's Guide to Puzzles", we read: 'Jed - cocker spaniel mix dog commonly found underfoot'. Yep....

THE FIRST! Because you remember only flashing lights and sounds.

“Breaker, good buddy!”
the **CB craze** of the 1970s
continued well into the
1980s. 10-4!

When TV doesn't have to be buzzy, or distorted. With the new GE Widescreen 3000, you get America's colors big and beautiful.

The action comes at you in breathtaking, vivid color—the kind our GE color system is known for. This GE Widescreen uses a special VTR signal,

VTR

sent out by most broadcasters, to automatically adjust the color for you. So flesh tones look realistic and natural.

And the GE Widescreen 3000 offers rear-screen projection, eliminating bulky lenses and projector consoles between you and the screen. So you get a bright,

clear image on a compact, 21" screen.

In fact, with a picture this big, maybe one of the few people changing 270 lbs. In terms of

We bring good things to life.

GENERAL ELECTRIC

While you've been waiting patiently for the ultimate developments in projection tv and video recording, Mitsubishi has been quietly perfecting them. Well, maybe not so quietly.

Because, even before our new VS-510 projection tv and HS-300U video-cassette recorder became available, videophiles all over the country were standing in line.

lo-mo, freeze-frame, fast-forward, search, zoom-in, zoom-out, from clear across the screen.

No, however, both these products are in full-scale production. Sony can probably see their art from nearest Mitsubishi dealer shop. For the location, call (800) 447-4700 toll-free. And when you see them in action, you're going to wonder.

How does Mitsubishi do it? When nobody else in the world can?

In the VS-50, it does it with optical quality glass lenses and mirrors instead of the usual plastic. With seven stages of video amplification instead of the usual three.

- The game is a great way to learn about cycle racing.
- The game is a great way to improve your cycle racing skills.
- The game is a great way to have fun.

Coleco would enter the video-game market in 1982, but this year saw it release a number of electronic toys such as sports games, pinball and many others.

Video Games

The venerable **Atari 2600**, largely alone in the marketplace since its release in 1977, would find itself facing a threatening new competitor this Christmas season, **Mattel's Intellivision**. Featuring controllers that sported numeric keypads (with overlays detailing various game functions) and rotational knobs, it was an attractive upgrade from the aging 2600, kept alive only by virtue of its library of recognizable arcade titles and a continuing downward-trending price.

The 2600 would survive, however, and eventually win the longevity battle, selling until 1992, two years later than the Intellivision.

Magnavox's **Odyssey 2** provided another option for aspiring Christmas video-gamers. Sold as the **Philips Videopac** in Europe, the Odyssey 2 was the third most-popular console in the early 1980s. While it featured a full "computer" keyboard, it was **mostly useless**, and its hard-wired controllers led to "spaghetti" tangles.

New Life For Fairchild System

Zircon, Inc. may be the most inappropriately named company in the entire video-game business. Certainly, what the firm is doing for owners of the Channel F system previously manufactured by Fairchild Electronics is worth its weight in diamonds.

Beginning in time for the 1980 gift-giving season, Zircon took the Channel F out of mothballs and started trying to service owners on the customer list bequeathed to it by Fairchild. Not only is Zircon marketing the revised hardware developed just before the system was shelved by the original owner, but the company is willing to help existing owners upgrade by offering a special deal: the new unit costs only \$69.95 with a trade-in Channel F.

The system itself has held up very nicely despite the passage of years and the advent of new technology. The controllers, which combine paddle and joystick in a single device, work well and allow designers great latitude with their game designs.

Zircon is rapidly getting the

WHICH SYSTEM'S FOR YOU?

A distant last, the Fairchild **Channel F** featured only seven colours and a comparatively small number of games. It would not survive long past 1980.

Home Computers

Introduced in 1977 along with the TRS-80 and the Commodore Pet, the Apple II would launch Apple into a successful business, and by the mid-1980s it would become one of the world's most well-known computers (chiefly by virtue of its popularity in North American schools.) Technically rather crude, it had a booming business ecosystem that more than made up for it, spawning a number of popular titles such as Oregon Trail and Prince of Persia.

Two years after the Apple II, video-game manufacturer Atari would enter the home computer market with the Atari 400 and 800 models. Providing superior graphics and sound to other home computers of the time, and with a library of arcade conversions on cartridge, the Atari machines were also quite well-built and attractive as entry-level computers for children.

However, they would have a difficult time in the market with the release of much cheaper machines by competitors such as Commodore in the following few years.

1980 also marked the introduction of the first "pocket" computer. Manufactured by Tandy (owner of the Radio Shack chain of stores), it featured a one-line, 24 character display and was programmed by way of a built-in dialect of BASIC (the Beginners All-Purpose Symbolic Instruction Code.)

While its practicality was limited it was a very cool gadget nonetheless, and would establish a consumer market for portable computers that would finally meet ubiquity with the success of the smartphone nearly thirty years later.

Radio Shack
The biggest name in line computers

Radio Shack® Christmas Sale & Gift Catalog

For decades, nothing said "consumer electronics" like **Radio Shack**. Founded in 1921, by the mid-1950s it was selling "high fidelity" audio equipment under the **Realistic** brand. However, in the 1960s it fell on hard times and almost went bankrupt. Luckily, the **Tandy Leather Company** saw the potential in the consumer electronics market and bought **Radio Shack** for not much more than a song. (\$300,000)

In the late 1970s they jumped into the computer business with both feet, launching the **TRS-80** (Tandy / Radio Shack Z-80 microprocessor) Model 1 around the same time as the **Apple II** and the **Commodore Pet**, but the cheapest of the three. It soon became the best-selling PC line of the late 1970s, outselling the Apple II by up to 5 to 1.

In 1980, Tandy released the **TRS-80 Color Computer**, a reworking of a teletext terminal they had developed for farmers in the late 1970s. While not as cheap as the **Sinclair ZX80**, it had color, sound and a better (albeit still horrible) keyboard for all of \$399, double the price of the ZX80 but still far less than any contemporary competitor.

Derided by users of more expensive computers as the "Trash-80", it would sell well and give millions of people an introduction into home computing.

Many moved on to other platforms but still have fond (and not so fond) memories of TRS-80.

A PLEASANT MEMORY for TRS-80 users

Why I Like the TRS-80

Stephen B. Gray

It's become fashionable in many personal computer circles to call Radio Shack's machine the "Trash-80" to speak of its many shortcomings. The TRS-80 Model I has many of these shortcomings and is certainly inadequate for most users.

One answer is that Radio Shack provided what many people out there wanted, at a price they felt was right, and at a time when there were no other computers of its kind available.

One of the TRS-80's advantages is its ease of use. It's a machine that can be used by anyone, even those who have never used a computer before.

But the more I use the Level II computer, the more I like it. I know just about what it can do, and can't, and I recommend it to most of the people who ask me what personal computer to buy. Most, but not all. The TRS-80 can't do everything, which is why the Apple II, PET, Atari and Sever computer sell as well as they do.

Service and support are two of the main reasons for my liking the Level II TRS-80. As for service, when I had problems with my RAM memory, and also with the lower case modification, I called in. I had to do so, as I was a technician, and I had to do so, as I was a technician, and I had to do so, as I was a technician.

What I like about the TRS-80 is that it's a machine that can be used by anyone, even those who have never used a computer before.

One of the TRS-80's advantages is its ease of use. It's a machine that can be used by anyone, even those who have never used a computer before.

Merry Christmas From Your TRS-80*

FEATURING SOUND

COMPU CAROLS

ORDER NO. 0068 \$9.95

Here is a selection of all time Christmas favorites. These beautiful Christmas Carols will be displayed verse-by-verse, accompanied by clear, soft music on your TRS-80. The pretty music for each card is played for hours of enjoyment from your Micro. The soft musical notes offer an ideal Christmas setting, seeming to blend with the festive spirit of the season.

First appearing in the mid 1970s, the Japanese electronics manufacturer Casio brought calculator watch prices down to a more consumer-friendly level in the early 1980s. Kids everywhere rejoiced (and cheated on mathematics exams!)

Digital watches with stopwatch timers, reminders and the ability to play synthesized music were also popular Christmas gifts.

My first calculator watch was really cool, but before long the buttons fell out! It wasn't much use after that happened. Happily later models didn't suffer from such defects.

The adoption of the home computer (starting with the Apple II) soon led to the appearance of commercial "home-use" software (eg games) such as Zork and the first Flight Simulator. These became a trusted Christmas choice (who doesn't like games?)

Give Your Computer the Best

The Microline 80

Seasons Greetings

Even in 1980 people thought it was important kids learn how to code!

This Christmas, don't give a toy...

Give a Microtek

The market is flooded with low-cost printers and last more like toys. On the other hand, the Microtek MT-80, our

Special editions for Apple, Atari and TRS-80 Computers.

Programming is Child's play

...and this is how.

A chief method of software distribution in the early 1980s, magazines published "listings" of mainly BASIC programs for readers to type in.

Frequently buggy, and plagued with typos, the reader was usually forced to fix the errors themselves, leading to an enforced learning of computer programming.

Type this into any Apple II (computer or emulator) or Paleotronic microM8!

CHRISTMAS TREE

Stephen R. Berggren

One of the most enjoyable jobs of the Christmas season is decorating the Christmas tree. It is unfortunate that this pleasant and satisfying task can only be done once each year. Besides, how can you be any good at something you do only once a year? You should be able to decorate a Christmas tree whenever you want to. Can a personal computer solve a problem like this? Of course, it can! Using the *Christmas Tree* program you can decorate and display your own Christmas tree any time you want to.

The *Christmas Tree* program displays a Christmas tree and allows you to decorate it with up to 200 colored lights. Game paddles control the placement of the lights. The colors may be red, green, blue, violet or white. A delete function can be used to erase any mistakes. Once the tree is decorated to your satisfaction, it can be displayed with either flashing or non-flashing lights.

The program was written for the Apple II computer. The language used is Applesoft, the floating point version of Basic used in the Apple II. The program can operate under either the ROM or RAM versions of this language. However, under the RAM version, the number of lights used may be limited to about 150. Using any more lights may overwrite the graphics screen. Removing the REM statements will allow more lights to be used. The program makes use of the hi-resolution color graphics, game paddle inputs and shape table drawing routines of this system. Other systems with color graphics such as the Atari or the CompuColor should be able to run the program after changing the drawing and cursor routines. Of course, the data used to draw the tree must be modified to fit the different screen sizes.

The program itself is really very simple. Line 10 sets aside memory for the X and Y position and color of each light. The "G" sign means that they are integer

values. After providing directions in lines 200 to 370, it uses lines 600 to 710 to draw the outline of a Christmas tree in green on the hi-resolution graphics screen. The data table at lines 150 and 160 provides the shape. Note that it draws the shape twice with the second shape right next to the first. This just makes a wider line. Next, a very simple shape table is put into the memory using data at line 840. This shape is a tiny square made up of four dots. This shape is used to draw the lights and is also the cursor that shows where the lights will be placed. Its size is just large enough to show clearly on the screen. Now the program uses lines 1010 to 1060 to put a cursor on the screen in a place determined by the two paddle controls. The

Once the tree is decorated to your satisfaction, it can be displayed with either flashing or non-flashing lights.

XDRAW commands at lines 1030 and 1050 reverse the colors of the background at that position. Since two reversals leave the screen looking just as it did, this procedure does not erase anything. The cursor may be moved anywhere without leaving a trail.

As the cursor is being drawn, the program uses line 1040 to see if a key has been pressed. If one has, lines 2040 to 2080 determine what key was pressed and branch to the needed routines. Line 2035 is simply a warning that all 200 lights have been put on the tree. Lines 2088 to 2130 put the light on the screen at the cursor position and put the position and color into memory. If a light is to be removed, the program jumps down to lines 6000 to 6030. This subroutine checks the position of the cursor against the positions in memory. If it finds a match, it changes the color in memory to black and erases the light from the screen.

When the Christmas tree is finished, a "Control-N" key will send the program to lines 5000 to 5040. There the cursor square is removed and the program waits for a carriage return while the tree remains displayed. If a "Control-I" is typed instead, the program goes to lines 3000 to 4060. The cursor is first removed. Then a light is selected at random and turned on while another light is selected at random and turned off. This process is repeated very rapidly and gives the effect that the lights are flashing. The flashing continues until interrupted by a "Control-C" or "reset."

Several modifications to the program might be interesting. First, by saving the arrays that hold the light colors and positions a particularly pleasing tree might be kept indefinitely. Second, shape tables for stars, candy canes or bells could be included to allow for decorations besides lights. Finally, a means for drawing lines could be included to draw in background and unique decorations.

Decorating is part of the fun of the Christmas season. With this *Christmas Tree* program your computer can contribute to this fun by displaying a beautiful Christmas decoration designed by you. Merry Christmas!

JRBN CHRISTMAS TREE
BY STEPHEN R. BERGGREN

THIS PROGRAM ALLOWS YOU TO DECORATE AND DISPLAY A CHRISTMAS TREE. YOU MAY PUT UP TO 200 LIGHTS ON THE TREE AND MAKE THEM FLASH OR GLOW SLOWLY.

TO PUT LIGHTS ON THE TREE, MOVE THE FLASHING DOT TO THE RIGHT POSITION AND PRESS A COLOR KEY. WHEN FINISHED, PRESS "CTRL-F" FOR FLASHING LIGHTS OR "CTRL-N" FOR NORMAL. THESE ARE THE AVAILABLE COLORS. "DELETE" REMOVES THE LIGHT UNDER THE CURSOR.

M = WHITE G = GREEN
R = RED U = VIOLET
B = BLUE D = DELETE
(PRESS RETURN TO BEGIN)

Printers were also a popular Christmas gift; the dot-matrix versions could print monochrome graphics, but even a daisy-wheel printer could still replace the hated manual typewriter loathed by children everywhere.

Even in 1980 people thought it was important kids learn how to code!

A vintage computer monitor with a beige frame. The screen is black and displays the text "a HUGE Thank You to all of our Kickstarter backers!" in a bright green, pixelated font. The monitor is part of a larger beige unit, with two horizontal slots and small red indicator lights visible below the screen.

a HUGE
Thank You
to all of our
Kickstarter
backers!

Thanks to you,

Paleotronic Magazine uses out-of-print magazine articles, vintage product advertisements, stock product images and other freely-available image assets for educational, transformative, artistic and critique purposes, covered by fair-use provisions in most countries. We value and thank the creators of these assets for their efforts, and will do our best to use their creations in the way in which their creators intended: to inform and to encourage readers and viewers to explore vintage technologies.

In that spirit, Paleotronic Magazine only copyrights the wholly original (not transformative) text and image content of our publications, and only for a period of five years after the date of publication. After that time, our works will fall into the public domain, so that others may carry on in a similar vein. It is not our intention to unfairly profit off of the efforts of others, only to make their works relevant once again so that they are not forgotten, and continue to have an impact on the public sphere.
